Questions Mock Endterm (Economics Track)

This mock endterm is written for the **Economics** and **Data Analysis and Economic Policy** MSc programmes. It draws on the core material of weeks 1 to 5 together with the economics track's weeks 6 to 8: binary outcome models (lecture 6), time series and prediction (lecture 7), and the replication of Olken (2007) (lecture 8).

In the real endterm all course material is potentially relevant, but the questions are more heavily focused on the latter part of the course.

> **Note**
>
> The questions below are still being written. Until they are published, use the mock midterm, which covers the five core lectures.

MC Questions

Multiple-choice questions on binary outcome models, time series and prediction, and the design and interpretation of a randomized experiment will be published here.

Open Questions

Open questions will be published here. Expect the same format as the mock midterm: a short applied scenario, a small table of results or a fitted equation, and questions that ask you to state the model, name the identifying assumption, compute a quantity, and interpret it in the units of the problem.
